

Revitalise your smile

Dr. Stuart Goddard BDS

Tooth Whitening is one of the easiest ways to enhance your looks. Whether you want to have that bright, white smile for your wedding day, or you wish to feel more confident when you smile in those important business meetings, whitening is simple affordable and safe. Despite all the whitening products that are on the market only a dentist can diagnose the cause of your tooth discolouration, see that whitening will work, and prescribe a treatment that will work for you.

Questions & Answers...

Does it cause any harm?

NO. Some patients can experience temporary sensitivity but this can be minimised by careful selection of the whitening gel used.

Does it work?

YES.....but only on teeth. Crowns/veneers/fillings will not whiten and may need to be changed following whitening. You will be informed when this may apply before whitening is begun. Despite this tooth whitening is still the easiest, most cost effective way to improve your smile.

How long does it last?

Results can last indefinitely with some very simple maintenance. We recommend wearing the whitening trays for one night every other month.

Can I pay in instalments?

We can often offer 0% finance, spreading the cost over 12 months at no extra cost.

How do you whiten teeth?

Over the years teeth soak up the stains from tea, coffee, smoking etc. This process is gradual and can take many years to discolour the teeth beyond an acceptable limit.

The whitening is accomplished by wearing whitening trays in 2-8 hour stints. Whitening trays fit well and are comfortable to wear. They are similar to very thin gum shields.

How long does it take?

Unfortunately the current trend is to promise white teeth in 45-60 minutes. To get the best result whitening gel needs to be in contact with your teeth for longer. We alter our whitening procedure to suit you, but on average 2-4 weeks of whitening will give a great result.

Do I have to wear the whitening trays at night?

No. 2 hour stints will be sufficient to accomplish a change in the colour of your teeth. If you can wear them through the night the colour change will occur more quickly as the gel is in contact with your teeth for longer.
